

Veritas Access Software Upgrade Monitoring

Date: 30 August 2026

Department: System Engineering

Activity: Veritas Access Software Upgrade Monitoring

Environment: Enterprise Infrastructure

1. Overview

During my internship, I observed a senior System Engineer performing a Veritas Access software upgrade through a remote terminal using MobaXterm.

2. Activity Details

The system was being upgraded from version 8.3 to version 8.5. The senior used the following command to check the upgrade status:

```
system software upgrade-status
```

The system showed that the upgrade was **RUNNING**.

3. Upgrade Process Observed

- Preparing for the upgrade
- Syncing the upgrade package across cluster nodes
- Validating the upgrade package
- Checking the upgrade status regularly

4. Key Learning

- Veritas Access
- Software upgrade process
- Cluster and cluster nodes
- Upgrade package synchronization
- Upgrade status monitoring
- Remote system management using MobaXterm

5. Conclusion

This activity helped me understand how a System Engineer monitors a software upgrade in an enterprise environment. It also gave me practical knowledge about Veritas Access and cluster-based systems.

Note

This documentation is based on my observation during the internship. No production changes were performed by me.
