

IFIC Bank Data Center Visit and CSSS CCTV Health Check

Date: 23 August 2026

Organization: Express Systems Limited

Project: IFIC Bank Server Infrastructure

Task: CSSS CCTV Health Check (CSSS CCTV HC)

Department: System Engineering Team

1. Introduction

On 23 August 2026, I had the opportunity to visit the data center of **IFIC Bank** as part of my internship at **Express Systems Limited**. IFIC Bank is one of the projects supported by our company, and the visit was conducted as part of a server infrastructure maintenance and health-check activity.

A senior engineer from the System Engineering Team was assigned to perform the task, and I accompanied him to observe the complete process and gain practical knowledge about data center operations, Dell server management, and health-check procedures.

The main purpose of the visit was to perform a **CSSS CCTV Health Check (CSSS CCTV HC)** and collect the required system logs from the servers for further analysis and report preparation.

2. Purpose of the Visit

The main objectives of the visit were:

- To observe a real-world enterprise data center environment.
- To understand the basic procedure of performing a server health check.
- To learn how Dell PowerEdge servers are accessed and monitored remotely through **iDRAC**.
- To collect system and storage-related logs for health analysis.
- To gain practical exposure to enterprise server maintenance procedures.
- To understand how collected server logs are later used to prepare a health-check report.

3. Data Center Entry and Verification

After arriving at the IFIC Bank premises, we completed the required verification and security procedures before entering the data center.

After successful verification, we were permitted to enter the data center area. My senior engineer explained the basic working environment and the equipment involved in the assigned task.

4. Server Infrastructure Observed

During the visit, I observed that the server environment consisted of **seven Dell PowerEdge R750xs servers**.

These servers were part of the infrastructure associated with the project. I had the opportunity to observe the physical server setup and understand how enterprise servers are managed in a professional data center environment.

5. iDRAC Connection and Server Management

For the health-check activity, my senior engineer connected an **Ethernet cable to the iDRAC (Integrated Dell Remote Access Controller) management port** of the server.

The iDRAC management interface allows administrators to remotely monitor and manage Dell PowerEdge servers.

After establishing the connection, the senior engineer accessed the server using its assigned **management IP address** through a web browser.

The login page was then accessed using the authorized username and password. After successful authentication, the iDRAC management dashboard was displayed.

6. Log Collection Procedure

From the iDRAC dashboard, my senior engineer navigated through the following menu:

Maintenance → SupportAssist

The SupportAssist section was used to collect the required diagnostic information and logs from the server.

The required logs included:

- **Storage Log**
- **Debug Log**

The system processed the requested information and generated the required diagnostic package.

After the log collection process was completed, a **ZIP file** containing the collected information was downloaded.

7. Process Repeated for All Servers

The same procedure was performed for all **seven Dell PowerEdge R750xs servers**.

For each server:

1. The iDRAC management port was accessed.
2. The management IP address was entered.
3. The authorized credentials were used to log in.
4. The iDRAC dashboard was accessed.
5. **Maintenance → SupportAssist** was selected.
6. Required storage and debug logs were collected.
7. The generated ZIP file was downloaded.
8. The downloaded file was retained for further analysis and reporting.

After completing the log collection from all seven servers, we left the data center and returned to the office.

8. Outcome of the Task

The main activity completed during the visit was the successful collection of the required diagnostic log packages from all seven Dell PowerEdge R750xs servers.

The collected ZIP files will be used for further analysis and to prepare the **CSSS CCTV Health Check Report**. The final health-check report will provide information about the condition and status of the relevant server components based on the collected logs.

9. Knowledge and Experience Gained

This visit provided me with valuable practical exposure to enterprise-level IT infrastructure. As a fresher and intern in the System Engineering Team, I gained an understanding of several important areas:

- Real-world data center working procedures.
- Enterprise server infrastructure.
- Dell PowerEdge server hardware.
- iDRAC-based remote server management.
- Server management through a dedicated management IP.
- Dell SupportAssist and diagnostic log collection.
- Storage and debug log collection.
- The importance of server health monitoring and maintenance.
- The process of collecting technical information for preparing a health-check report.
- Professional data center access and security procedures.

10. Conclusion

The IFIC Bank data center visit on **23 August 2026** was an important practical learning experience during my internship at Express Systems Limited.

Although I participated primarily as an observer under the guidance of my senior engineer, the visit helped me understand how enterprise server maintenance and health-check activities are performed in a real production environment.

In particular, I learned how to access Dell PowerEdge servers through iDRAC, navigate to the SupportAssist section, collect storage and debug logs, and download the diagnostic packages required for further analysis.

The collected logs from the seven servers will subsequently be analyzed and used to prepare the final **CSSS CCTV Health Check Report**.
